

Glacier Hills Snow Plowing Guidelines

- I. An accumulation of 2" or more will signal the need for plowing, when quick melting is not expected.
- II. Access to equipment capable of handling sustained heavy snow loads is required.
- III. Snow is to be plowed to within 12" of the pavement edge.
- IV. Driveway berms will not be specifically plowed. Plow drivers are requested to minimize these to the extent possible during initial plowing.
- V. No berms are to be left between the walkway and the left (west) side (as you exit) of the main entrance gate.
- VI. When sanding is needed, only regular sand or fine gravel is to be used unless otherwise approved.
- VII. If it is necessary to plow over gravel surfaces, please lift the plow blade an inch or two until the surface is frozen and snow covered.
- VIII. For all issues relating to plowing, the lead contact will be Greg Doggett, 406-387-4707. His backup will be Jim Zerbe, 406-309-5083.
